CSR Partnership Radar — Components Map

Mesa C4 · AI Final · Problem Statement 9 (High) · as built and live, 12 Oct 2026 · numbered in the order a daily run happens

AI judgement (Gemini) · deterministic code · data, database & external services · a person acts

	TRIGGER	INPUT	CONTEXT	PROCESSING	AI	OUTPUT
Ananya Head of Corporate Partnerships · Pune NGO	0 Clicks **Refresh now** on the dashboard, or **Run & email digest** in Settings. Examiners: one-click **Enter as examiner**.		T Edits **Settings**: sectors & keywords, regions (Pune → Maharashtra → India), 16 scoring weights, thresholds, NGO profile & verified proof points, recipients. No code, no deploy.			18 Reads the Monday email and the dashboard, opens a brief, **edits and sends outreach herself**, moves the deal and logs calls in the CRM. ⚑ nothing is ever sent to a company by the system
Scheduler Vercel Cron	1 Daily 02:00 UTC = **07:30 IST**, bearer secret. Mondays → digest email. Runs stuck >10 min are reaped.					
News feeds Google News · Bing News · CSR trade press		3 **Google News**: ~15 searches built from settings (7 days) + 3 policy searches (**30 days**). **Bing News**: 14 keyword searches. **India CSR, The CSR Journal, The CSR Universe** feeds.				
Pipeline Next.js 16 on Vercel	2 One run at a time. Returns at once, continues in **after()** (300 s budget). Every stage writes its counts → live progress bar and Runs page.			6 **Clean**: time windows, canonical URLs, stored once; same story from other outlets merged into one card; free pre-filter drops adverts → listed as **Cold** with the reason. 9 **Verify quote**: it must appear in the source text, else –10 and no override. 10 **Radar score** 0–100 from her weights → Hot · Warm · Cool · Cold · Policy. Open calls (corporate CSR) and explicit partner searches are **always Hot**. 13 **Guard**: any number in a draft that is not in the story or her NGO profile is flagged before she sees it.		16 **Dashboard**: Hot & Warm cards (open-call countdown), Policy watch (30 d), Cool, **every Cold story ranked** (top 25 + show all), briefs, pipeline board, Runs, How it works.
LLM Gemini 3.7 Flash · OpenRouter · Google providers only					4 **Search** (native Google Search): proposes open CSR **RFPs / EOIs** (last 30 days, deadline open, corporate funders only) and headlines the feeds missed. 8 **Read**: 10 stories per call → signal, company, sectors, places, ₹, deadline, partner search, audience fit + **verbatim quote**. JSON schema, temp 0. Decides nothing. 11 **Contact**: spokesperson named in the story, else Google Search for the CSR head, kept only with a source. **Never guesses emails.** 12 **Draft**: buyer-journey stage (set by code) → JTBD, facts vs assumptions, Hook · Pain · Value · CTA, follow-up with a new angle. 14 **Summary**: "the week in one minute" from the ranked facts only.	
Database Neon Postgres			7 Settings read fresh every run · each story's reading **cached** (never paid twice) · 90-day company history → "warming".			15 Stored: stories, signals, every run's funnel, source health, tokens & cost · **micro-CRM**: companies, contacts, deal stage, next steps, activity log.
Web company & CSR pages · CSR Exchange portal		5 **Verify**: an open-call page must load and name the funder; an AI-found headline must match a real Google News article. Otherwise dropped.				
Email Resend						17 **Monday email** to her inbox: dashboard snapshot (signed PNG) + **only the Hot companies**, each linking to its brief.

The Cut — three things the radar never does

1. **Never contacts a company for her.** It drafts; Ananya edits and sends every email herself. The digest goes only to her inbox.
2. **Never guesses.** No invented contacts, emails or numbers: contacts need a source, quotes are checked against the source, numbers in drafts are checked by code.
3. **Never hides a story.** Off-sector, filtered and low-scoring stories stay listed as Cold, ranked, with the reason; she may know someone there.

AI proposes, code decides, Ananya chooses

Gemini searches, reads, finds contacts and writes. Everything that must be predictable is code: time windows, deduplication, the quote check, page verification for open calls, the 0–100 radar score from her 16 weights, the always-Hot rules, the invented-number guard. When she changes a weight in Settings, the next run re-scores every story with no new AI call; changing a sector or region changes the searches themselves. Every run's funnel, source health, tokens and cost are logged on the Runs page.

Running cost (measured)

- Daily run with all 5 sources: **≈ $0.21** of Gemini (avg of live runs), most of it the open-call search → **≈ $6 a month**.
- Reading only new stories: ≈ $0.01 per run (each reading cached); first full read of a week: $0.72.
- Neon, Vercel (hosting + cron), Resend, RSS feeds: free tiers → $0.
- Measured from OpenRouter's usage field on every call; model google/gemini-3.7-flash ($0.75 / $3.75 per million tokens).
